### Arrhythmia Drugs: List of Drugs That Treat Arrhythmia

The ultimate goal of antiarrhythmic drug therapy is to restore normal rhythm and conduction. When it is not possible to revert to normal sinus rhythm, drugs may be used to prevent more serious and possibly lethal arrhythmias from occurring. Antiarrhythmic drugs are used to: decrease or increase conduction velocity

## **CV Pharmacology | Antiarrhythmic Drugs**

Antiarrhythmic agents, also known as cardiac dysrhythmia medications, are a group of pharmaceuticals that are used to suppress abnormal rhythms of the heart, such as atrial fibrillation, atrial flutter, ventricular tachycardia, and ventricular fibrillation. Many attempts have been made to classify antiarrhythmic agents. The problem arises from the fact that many of the antiarrhythmic agents have multiple modes of action, making any classification imprecise.

Antiarrhythmic Drugs. Antiarrhythmics address arrhythmia by altering cells' automaticity and conductivity. All cells in the heart are capable of undergoing spontaneous contractions (automaticity). Therefore, these cells are capable of generating excitatory impulses.

## **6 Antiarrhythmic Drugs for Atrial Fibrillation**

The book attempts to set out a framework for understanding antiarrhythmic drugs: how they work, what they actually do to improve (or worsen) the cardiac rhythm, and the factors one must consider in deciding when and how to use them. Such a framework, it is hoped, will not only serve as a guidepost in making clinical decisions, but will also provide a basis for interpreting new information that comes to light on antiarrhythmic drugs and their place in the treatment of cardiac arrhythmias.
