Contrary to the notion of the supremacy of vision and its intrinsic relationship to the brain, Hara considers the mind is not singular and seated within the head; it exists throughout the body, like a system of tsubo, or acupoints.. This vision is the core of multi sensory design, with the idea that we must approach the act of design by targeting the body's multitude of brains.

Distributed Architecture - Tutorialspoint

Danny Weyns' book is organized according to the postulate that "developing multi-agent systems is 95% software engineering and 5% multi-agent systems theory." He presents a software engineering approach for multi-agent systems that is heavily based on software architecture - with, for example, tailored patterns such as "situated agent", "virtual environment", and "selective perception" - and on middleware for distributed coordination - with programming abstractions such as "views" and "roles."

Multi-core Architectures

development of a new accelerated architecture based on GPU and multi-processor design based on a new algorithm for fingerprint recognition based on the extraction and matching of Minutiae. The remainder of this paper is organized as follows: Section 2 introduces the developed pre-processing algorithm.

Architecture Based Design Of Multi Agent Systems

The multi-tier model is the most common design in the enterprise. It is based on the web, application, and database layered design supporting commerce and enterprise business ERP and CRM solutions. This type of design supports many web service architectures, such as those based on Microsoft.NET or Java 2 Enterprise Edition.

Multitier architecture - Wikipedia

A multi-core architecture (or a chip multiprocessor) is a general-purpose processor that consists of multiple cores on the same die and can execute programs simultaneously

Multi-core architecture: Advantages (Relatively) High performance/watt (Relatively) High performance/area Simpler core Possibility of lower cycle time, better optimisation etc. Ease of design, verification etc.

Multi-tier architecture is a client-server architecture in which the functions such as presentation, application processing, and data management are physically separated. By separating an application into tiers, developers obtain the option of changing or adding a specific layer, instead of reworking the entire application.
