1. Introduction. The laser tracker was invented in the mid-1980s by Lau et al. , , at the National Institute of Standards and Technology (NIST) to facilitate robot

metrology. Laser trackers are portable coordinate measuring systems (CMS) that measure the three-dimensional coordinate position of a cooperative target such as a spherically mounted retroreflector (SMR).

### **Distributed Large Scale Dimensional Metrology**

Distributed Large-Scale Dimensional Metrology introduces a new paradigm in this field that reverses the classical metrological approach: measuring systems that are portable and can be easily moved around the location of the measured object, which is preferable to moving the object itself.

Abstract In the field of large-scale dimensional metrology, new distributed systems based on different technologies have blossomed over the last decade. They generally include (1) some targets to be localized and (2) a network of portable devices, distributed around the object to be measured, which is often bulky and difficult to handle.
