Elements of differential topology (Book, 2011) [WorldCat.org]

A real function, that is a function from real numbers to real numbers can be represented by a graph in the Cartesian plane; such a function is continuous if, roughly speaking, the graph is a single unbroken curve whose domain is the entire

real line. A more mathematically rigorous definition is given below. A rigorous definition of continuity of real functions is usually given in a first ...

Differential topology is the study of the (infinitesimal, local, and global) properties of structures on manifolds that have only trivial local moduli. Differential geometry is such a study of structures on manifolds that have one or more non-trivial local moduli.

Derived from the author's course on the subject, Elements of Differential Topology explores the vast and elegant theories in topology developed by Morse, Thom, Smale, Whitney, Milnor, and others. It begins with differential and integral calculus, leads you through the intricacies of manifold theory, and concludes with discussions on algebraic topology, algebraic/differential geometry, and Lie groups.

Elements of Combinatorial and Differential Topology

Wikipedia says, rather pithily, that “differential topology is the field dealing with

differentiable functions on differentiable manifolds.” On the other hand, Wikipedia also says that “differential geometry is [the] discipline using the techniques of differential and integral calculus, as well as linear and multilinear algebra, to study problems in geometry.”

Differential topology may be defined as the study of those properties of differentiable manifolds which are invariant under diffeomorphism (differentiable homeomorphism). Typical problem falling under this heading are the following: 1) Given two differentiable manifolds, under what conditions are they diffeomorphic?

(1) It pays no attention to one basic concept of algebraic topology: the fundamental group. (2) It doesn't cover Čech homology, important in other areas, like dimension theory for example. (3) It doesn't stress the most important feature of algebraic topology: its connection to other areas of mathematics (analysis, differential geometry, etc.).

Modern topology uses very diverse methods. This book is devoted largely to methods of combinatorial topology, which reduce the study of topological spaces to investigations of their partitions into elementary sets, and to methods of differential topology, which deal with smooth manifolds and smooth maps.
