## Factor Analysis

Factor Analysis Factor analysis attempts to identify underlying variables, or factors, that explain the pattern of correlations within a set of observed variables. Factor analysis is often used in data reduction to identify a small number of factors that explain most of the variance that is observed in a much larger number of manifest variables.

## Interpretation of factor analysis using SPSS

Factor analysis is a process of simplifying the larger data into a fewer number of dimensions. It is used to determine latent variables that are found in a manifest variables. It can be used to simplify data, such as reducing the number of variables in regression models. This analysis groups variables together having similar kind of characteristics.

## Factor Analysis - IBM - United States

A factor analysis is a measurement model of an underlying construct. So like regression models, structural equation models, and latent class models, the focus is on understanding the structure of the relationships among variables. The specific focus in factor analysis is understanding which variables are associated with which latent constructs.

I demonstrate how to perform and interpret a factor analysis in SPSS. I discuss how to enter the data, select the various options, interpret the output (e.g....

## A Handbook of Statistical Analyses using SPSS

SPSS will nearly always find a factor solution to a set of variables. However, the solution is unlikely to have any real meaning if the variables analysed are not sensible. The first thing to do when conducting a factor analysis is to look at the inter-correlation between variables.

Principal components analysis (PCA, for short) is a variable-reduction technique that shares many similarities to exploratory factor analysis. Its aim is to reduce a larger set of variables into a smaller set of 'artificial' variables, called 'principal components', which account for most of the variance in the original variables.
