Are Boys Better Than Girls at Math? - Scientific American

By Colleen Ganley and Sarah Lubienski, posted May 23, 2016 —. In our last post , we summarized the current state of research on gender differences in mathematics. Taken together, the research suggests that although gender differences in math are small, some differences still exist in mathematics skills, attitudes, and career choices that we should pay attention to.

Gender Differences In Mathematics An

Gender differences in mathematics achievement and ability has remained a source of concern as scientists seek to address the under-representation of women at the highest levels of mathematics, physical sciences and engineering (Asante, 2010).

Math ability, in some societies, is gendered. That is, many people believe that boys and men are better at math than girls and women and, further, that this difference is biological (hormonal, neurological, or somehow encoded on the Y chromosome). But actual data about gender differences in math ability tell a very different story.

Gender differences in mathematics and science interest emerge in early childhood (Cvencek, Meltzoff, & Greenwald, 2011; Leibham, Alexander, & Johnson, 2013). Around early adolescence gendered patterns arise, concurrent with the development of gender identity and adult gender roles (Bandura et al., 2001; Calabrese Barton et al., 2013; Eccles & Roeser, 2011; Kurtz-Costes, Rowley, Harris-Britt, & Woods, 2008).

Evolutionary hypotheses suggest that sex differences in the ability to navigate and use spatial representation to solve mathematical problems were selected in our ancestors by the activities they performed—"hunter" men and "gatherer" women. One wonders, though, why such a trait would evolve differently in the sexes.

In addition, research suggests that gender differences in mathematics ability are minimal during early childhood and do not consistently arise until middle to late adolescence (e.g., Lindberg et al., 2010; Robinson and Lubienski, 2011). The current study addresses the need to delve into the affective-motivational dimension of students in the final years of primary education, as girls may be losing their motivation for mathematics as they advance through this particular educational stage.

It actually depends on which math outcomes we look at. At both elementary and secondary levels, boys and girls score similarly on many state tests, and girls get relatively good grades in math classes. However, some gender differences in math attitudes and skills appear during elementary school, and ultimately, boys are much more likely than girls to pursue careers in some key math-intensive fields, such as engineering and computer science.
