Gene probes find a wide variety of uses in molecular biology, and are essential tools for genetic research. The advent of solid supports, new DNA labeling techniques, and PCR technology has created a need for an up-to-date practical manual in this area. Gene Probes (Applications), describes techniques for specific research goals.

In quantitative PCR specific primer pairs (purple arrows) amplify the desired subtelomeric sequence from the pool of transcribed TERRA molecules. Fluorescence intercalating dyes bind the double-stranded amplicon, which is detected and analyzed by the RT-qPCR system.

The detection of viral RNA by RT-PCR in the saliva generally correlates well with the detection of antigen in the blood of infected cats. 23,24 While submitting a sample for RT-PCR to a specialised laboratory is more time-consuming and costly, it has the benefit that FeLV viral RNA in saliva, as well as in blood, can be detected as early as 1 week after FeLV exposure (ie, at least 2 weeks prior to detection of p27 antigen in the blood; Table 2). 27
