fusion reaction itself heats the plasma due to the production of the energetic helium atoms (actually ions, or α particles). The kinetic energy of the helium nuclei exceeds the average kinetic energy of the nuclei of the fuel (deuterium and tritium) by orders of magnitudes. The energy is distributed to the fuel nuclei via

Problems With Fusion Reactors: Solution Could Fix Tokamak Flaw

Novel design could help shed excess heat in next-generation fusion power plants. A class exercise at MIT, aided by industry researchers, has led to an innovative solution to one of the longstanding challenges facing the development of practical fusion power plants: how to get rid of excess heat that would cause structural damage to the plant.. The new solution was made possible by an ...

Cold Fusion Generator Alternative Energy Solution

Each p-d fusion will produce an atom of helium-3 and 5.5 MeV of energy from gamma radiation. About 2.3×10^{17} reactions per second will produce 200 kW. (c)

operates continually for longer periods than systems producing energy by transmutation or d-d fusion where their cathodes would be degraded more rapidly.

Fusion Basics | Princeton Plasma Physics Lab

This textbook accommodates the two divergent developmental paths which have become solidly established in the field of fusion energy: the process of sequential tokamak development toward a prototype and the need for a more fundamental and integrative research approach before costly design choices are made. Emphasis is placed on the development of physically coherent and

Tokamak-style fusion reactors, like the NSTX-U, pump most of the extracted energy into fast neutrons. Energy from these neutrons can be collected in a blanket that surrounds the plasma and can consist of a molten mixture of lithium and lead. Excess heat in this blanket can then be used to make steam to drive turbines and generate electricity.
